

Using geospatial technology, web-mapping and digital data services to deliver offshore project efficiencies

IOGP / IMCA / THSiS Industry Day
20th April 2016

Martin Day
Head of Survey & Geospatial
LR Senergy Survey & GeoEngineering

LR Senergy Survey & GeoEngineering

Integrated solutions for the marine energy sector

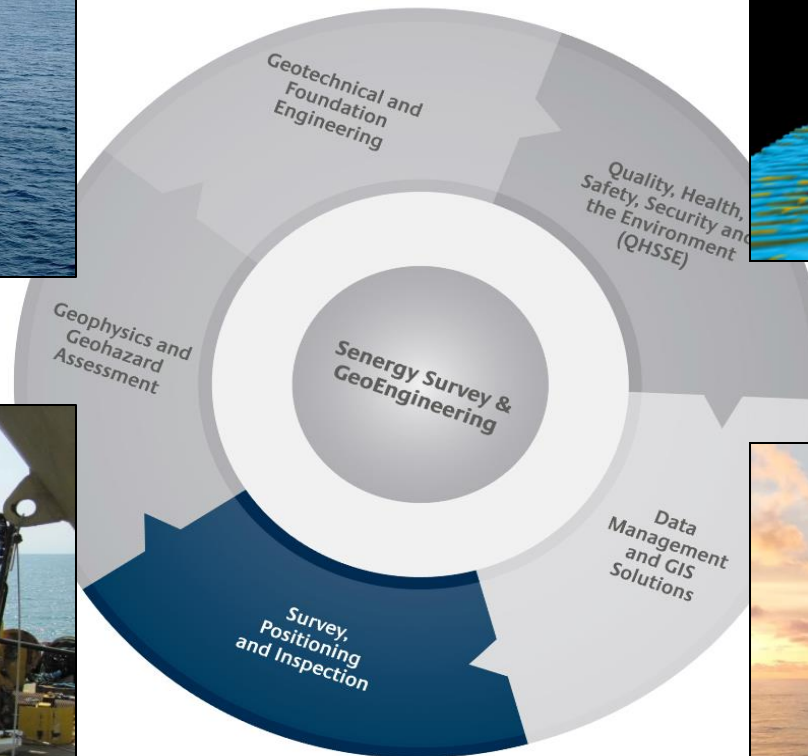

- Primary Services

- Consultancy
- Project Management
- Client Representation
- *GIS, Data Management & Data Delivery Services*

- Core discipline areas

- Geophysical survey project management
- Geotechnical site investigation project management
- Geophysics and geo-hazards consultancy
- Geotechnical and foundation engineering consultancy
- Strategic integrated geo site characterisation
- Ground risk management
- Data management & data delivery
- Cable installation
- Offshore construction support
- Subsea facilities inspection project management
- Positioning QA/QC services

LR Senergy Survey & GeoEngineering

Introduction

• Web Mapping Services

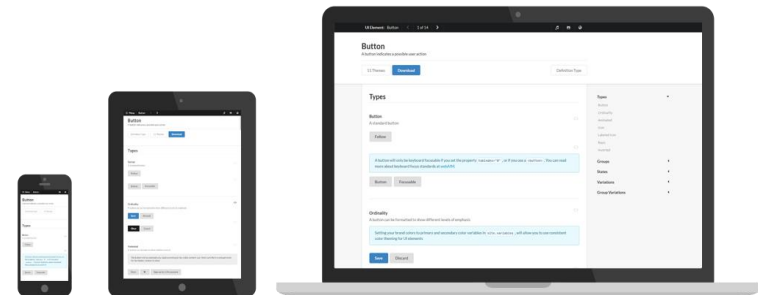

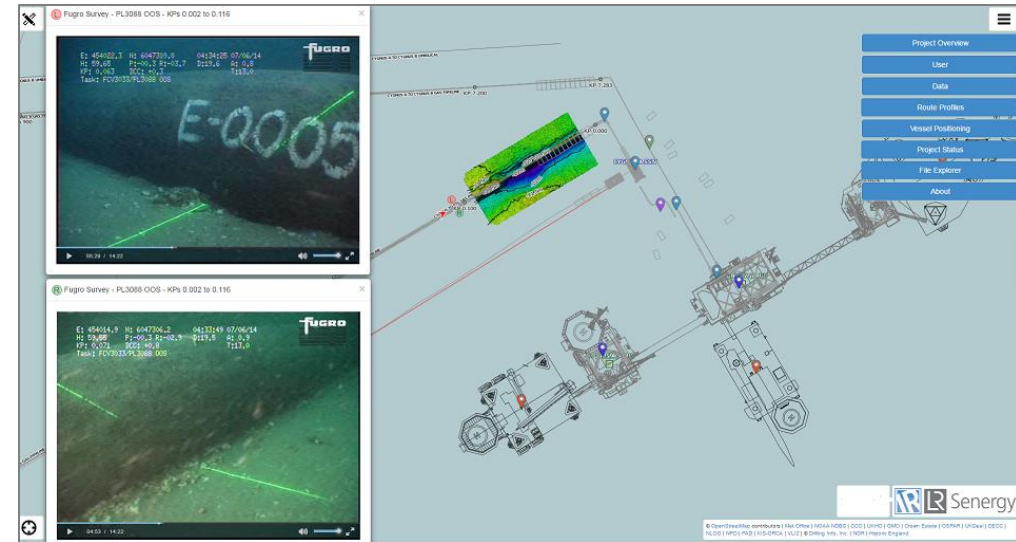

- Cloud data management
 - Static data
 - Shape files, MXD Databases
 - Images, video, documents
- Project planning
 - Cable routing
 - Offshore Wind farm consenting
- Emergency response
 - Vessel tracking
 - Helicopter tracking

• Project Management Use Case

- Visualise status and progress of offshore projects
 - Vessel tracking ; metocean
- Challenge is to identify tangible cost efficiencies
 - Digital data services
 - Software development within the browser

• Three case Studies

- Lay and trench project support
- Rig Positioning QA/QC
- Marine planning for OWF's

- Example data types and sources

- Web map services
- Vessel positions
- Metocean data
- Proprietary data feeds
- Video streaming
- File share through 3rd party synchronization services

- Create a valuable database

- Project performance data
- HSEQ Data
- Vessel, simops data
- Metocean data....

Example Data Services

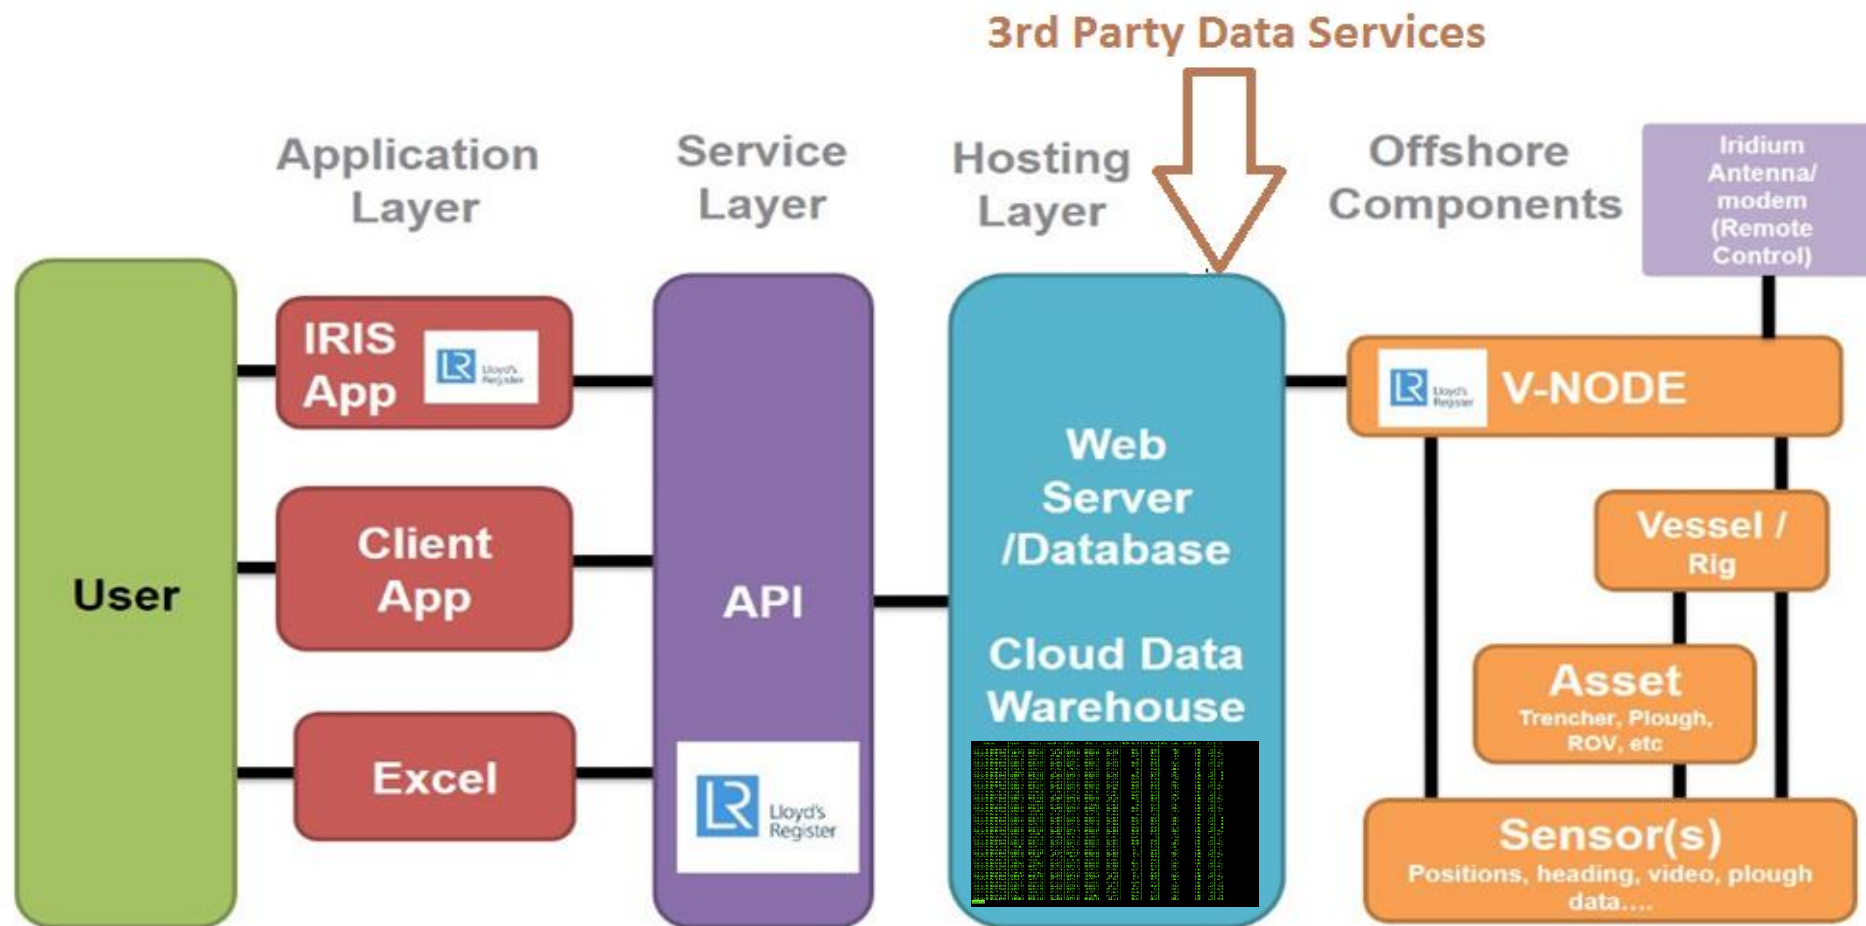

#	Data Type/Source	Web Service Type	Document Type
1	Vessel Positions GPS Unit Vendor	Pull API	XML
2	Vessel Positions Contractor Supplied	TCP/IP data stream	NMEA 0183
3	Vessel Positions V-NODE Unit Vendor	TCP/IP data stream	Bespoke Comma Separated ASCII
4	Vessel Positions Contractor Supplied	UDP data stream	NMEA 0183
5	Vessel Positions 3rd Party AIS Data Vendor	Pull API	JSON
6	Metoccean Forecast MeteoGroup	Email attachment	CSV
7	Metoccean Forecast Met Office	FTP upload	CSV
8	Metoccean Forecast GMO	Email attachment	CSV
9	Metoccean Forecast StormGeo	Pull API	XML
10	Metoccean Ovserations Met Office	Pull API	JSON
11	Metoccean Observations NOAA	Pull API	HTML
12	Metoccean Observations CCO	Pull API	GML
13	Telemetry Contractor Supplied	UDP data stream	Bespoke Comma Separated ASCII
14	Geospatial BGS Open GeoScience	Web Map Service	XML (capabilities) & PNG (imagery)
15	Geospatial DECC Oil & Gas Maps	N/A: Programatic File Download	ZIP/SHAPE
16	Geospatial CDA (Formerly DEAL)	N/A: Manual	ZIP/SHAPE
17	Geospatial Numerous 3rd Party Sources	Web Feature Service	GML

Vessel Tracking Example

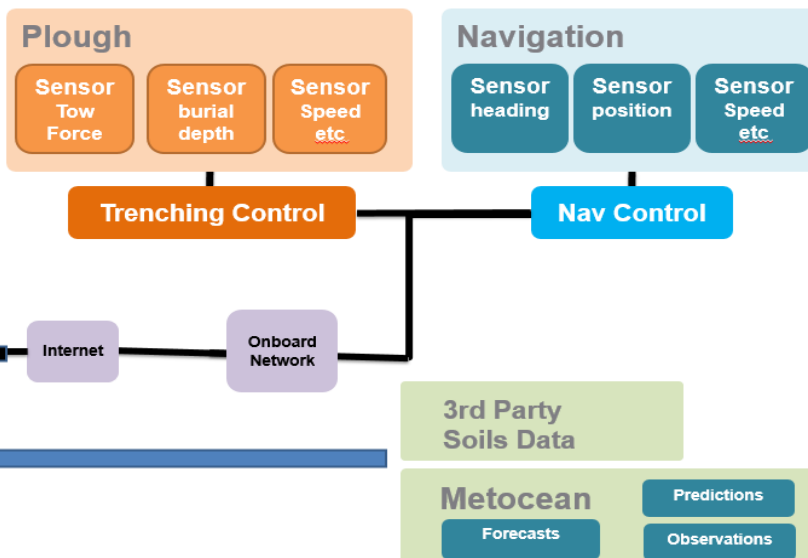

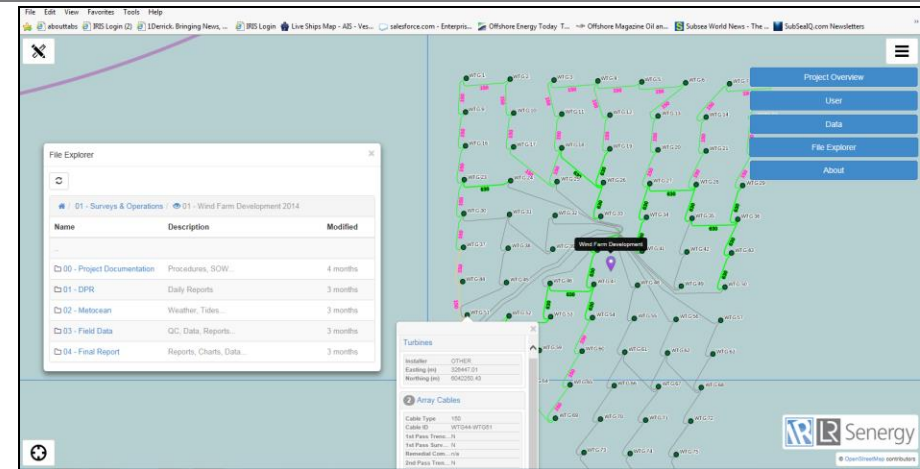

System Architecture

Example 1- Lay & Trench Project

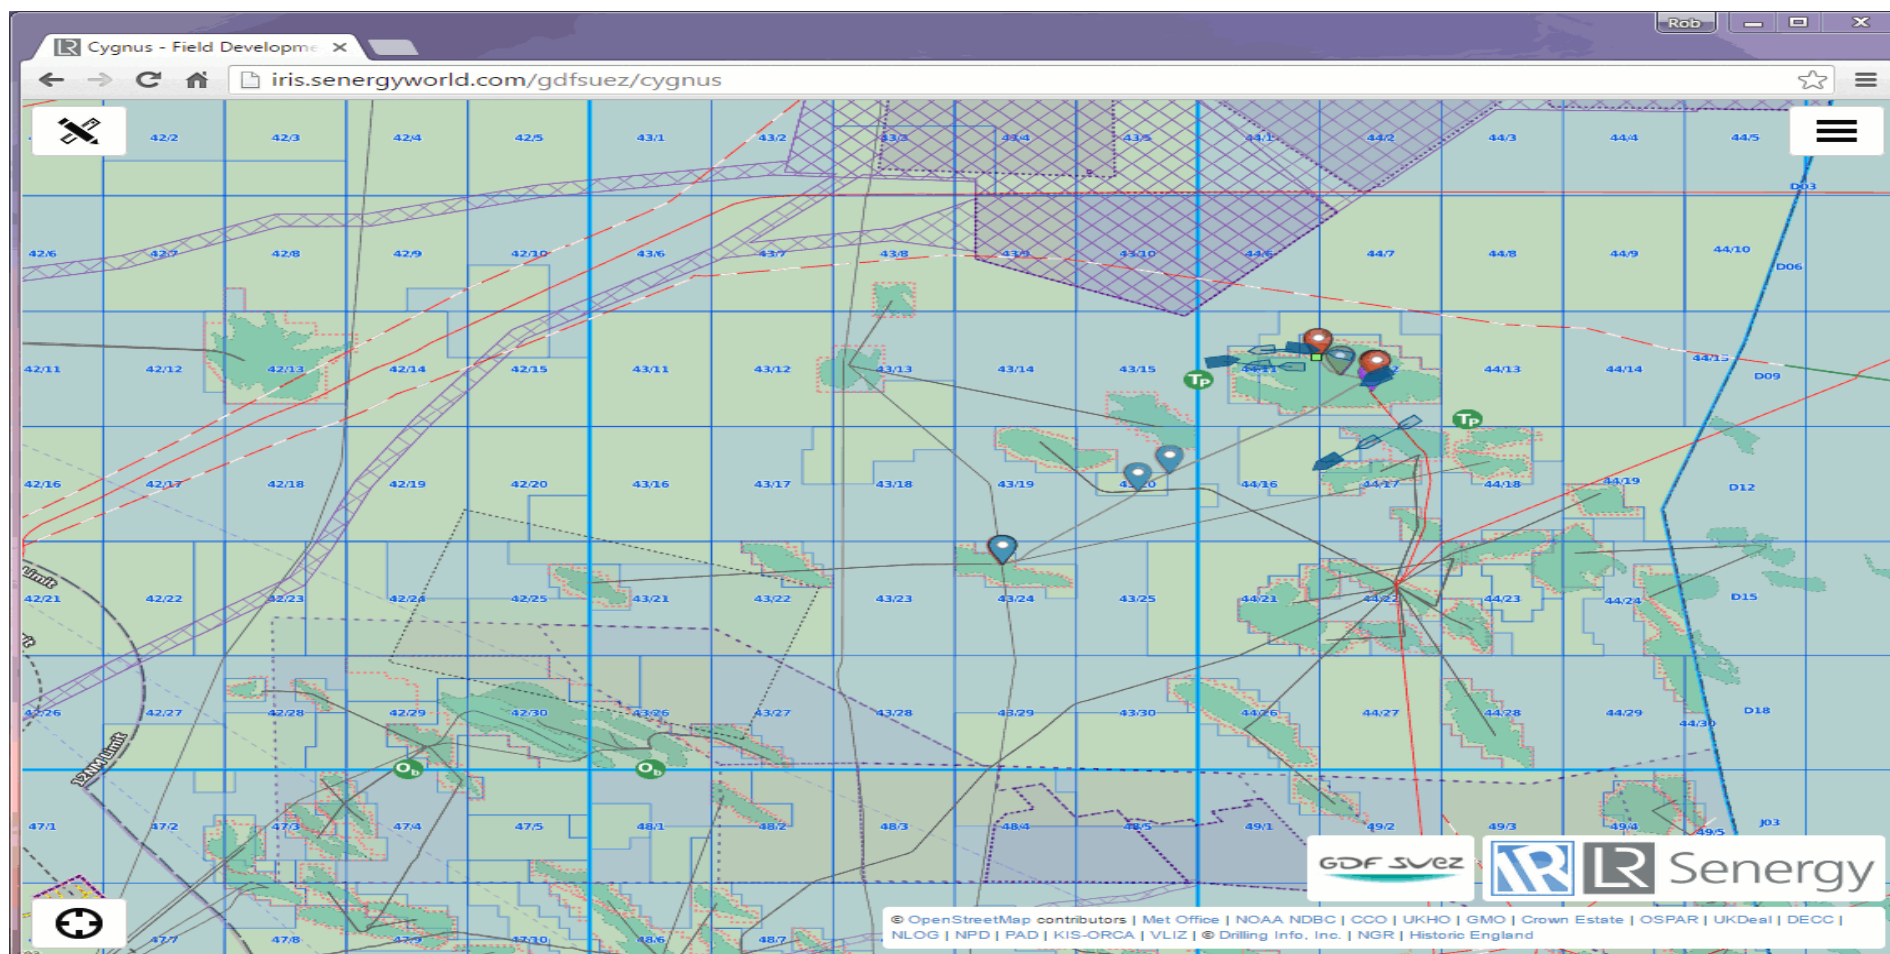

- Client : Major Lay & Trench Contractor
- Project Type : Lay & Trench
- Requirements
 - Close access to project status and progress
 - Trenching performance / contractual targets
 - Early notification/warning of performance/system issues
 - Access to live and forecast metocean data to support planning
 - Independent recording and replay of projects operations
 - Use proprietary message service and format

Plough Status Monitoring

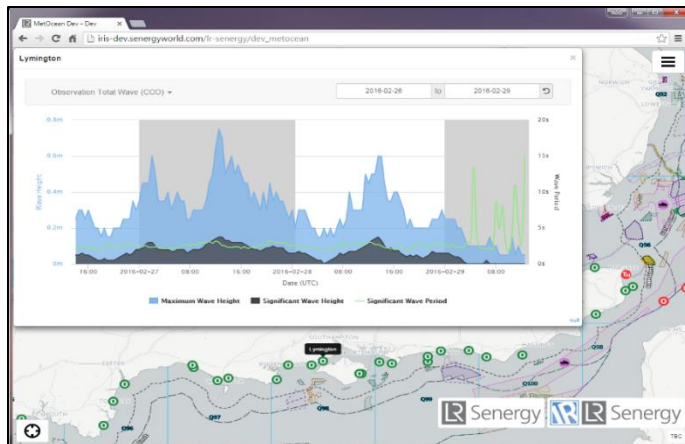

Longitudinal and Cross Profiles QC

Project Monitoring – Benefits

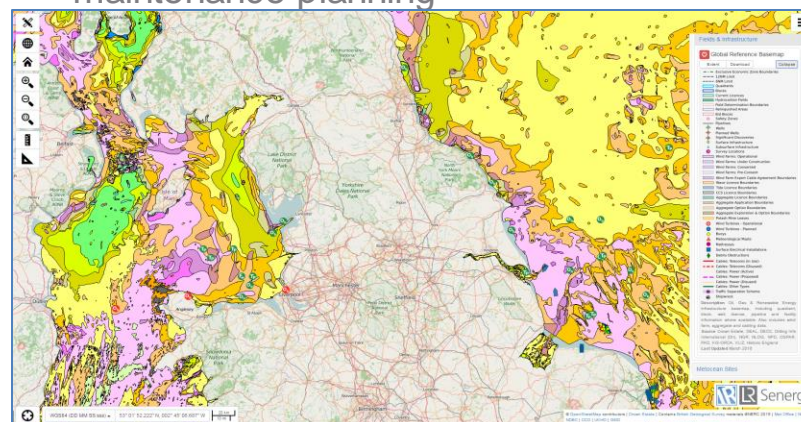

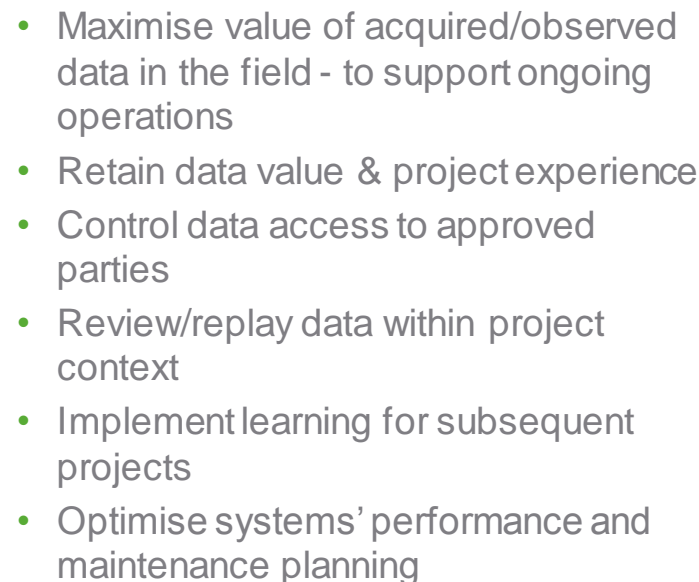

- Sharing of data
- Performance status monitoring
- Generation of alerts
- Simops and third party activities
- Planning / intervention optimised
- 24/7 visibility
- = maximise project efficiency

- Next Steps
- OEM Partnership
- Systems Monitoring
- Trenchers, ROV, subsea mining vehicles
- System performance monitoring
- Maintenance planning

13

Example 2

Rig Positioning ~ QC or not QC?!

- Offshore positioning of the following assets where a third party positioning provider is contracted:

- Semi-submersibles
- Jack ups
- FPSO
- Heavy Lift vessels

- Client approaches
 - Risk Assessment
 - Trust that all will be OK...

- OR provide for a positioning client representative
 - Assurance.....hopefully
 - Cost...~£15K

- Primary Issues
 - Geodesy
 - Offsets
 - measurement
 - implementation
 - Gyro
 - Installation
 - calibration

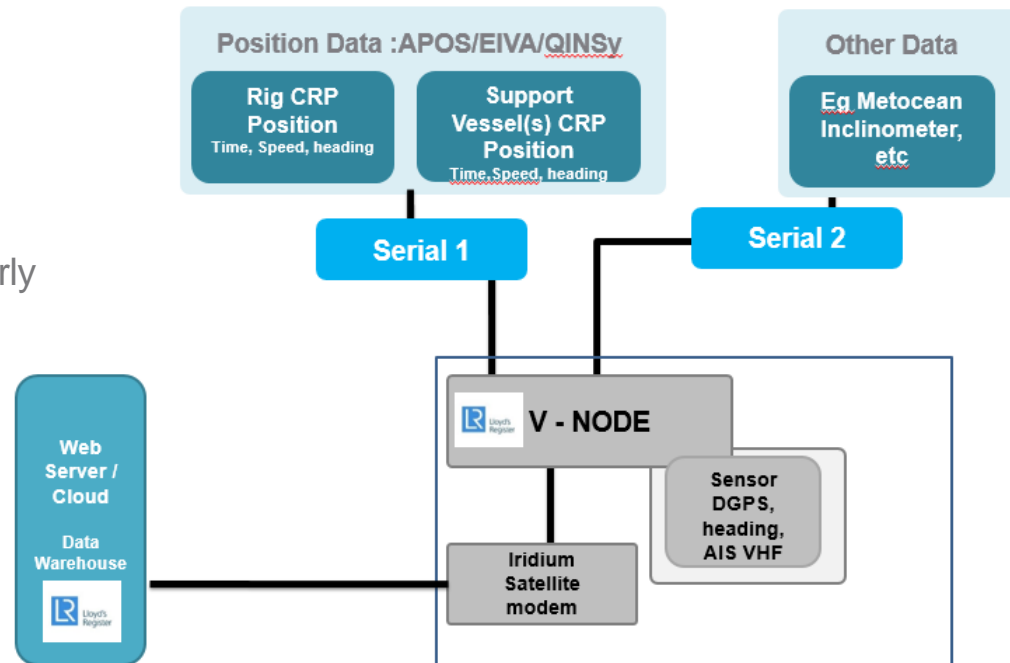

Remote Positioning QA/QC Service

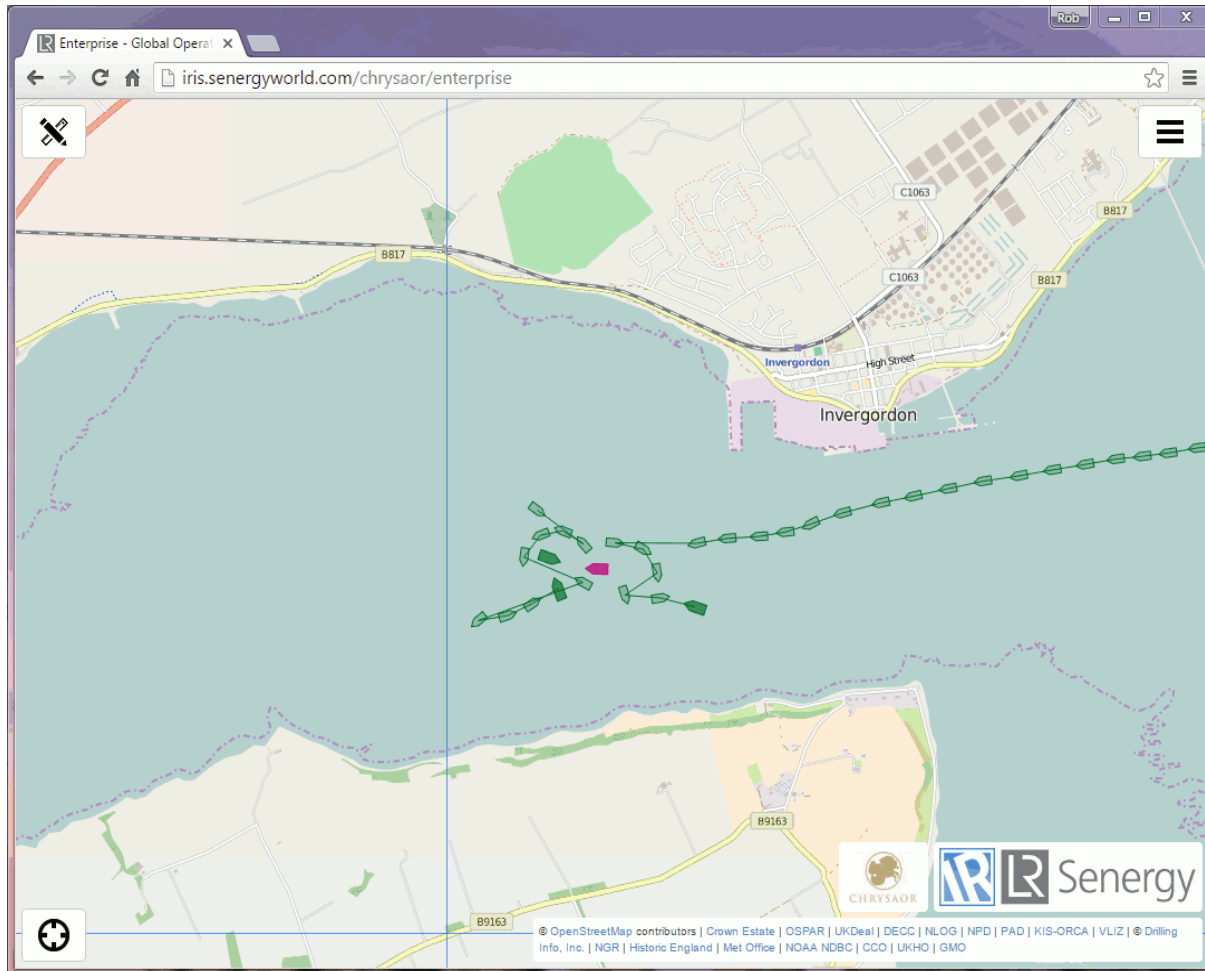

Using web mapping and digital services

- Stand-alone hardware unit - VNode
 - DGPS (SBAS – Space Based Augmentation Systems)
 - GPS Heading
 - AIS
- Contractor, or other approved body, installs hardware unit
 - Power-on; no user controls
- Offsets measured independently
 - Gross check against GA (LR)
 - Potentially installed next to contractor antennae or clearly identifiable location

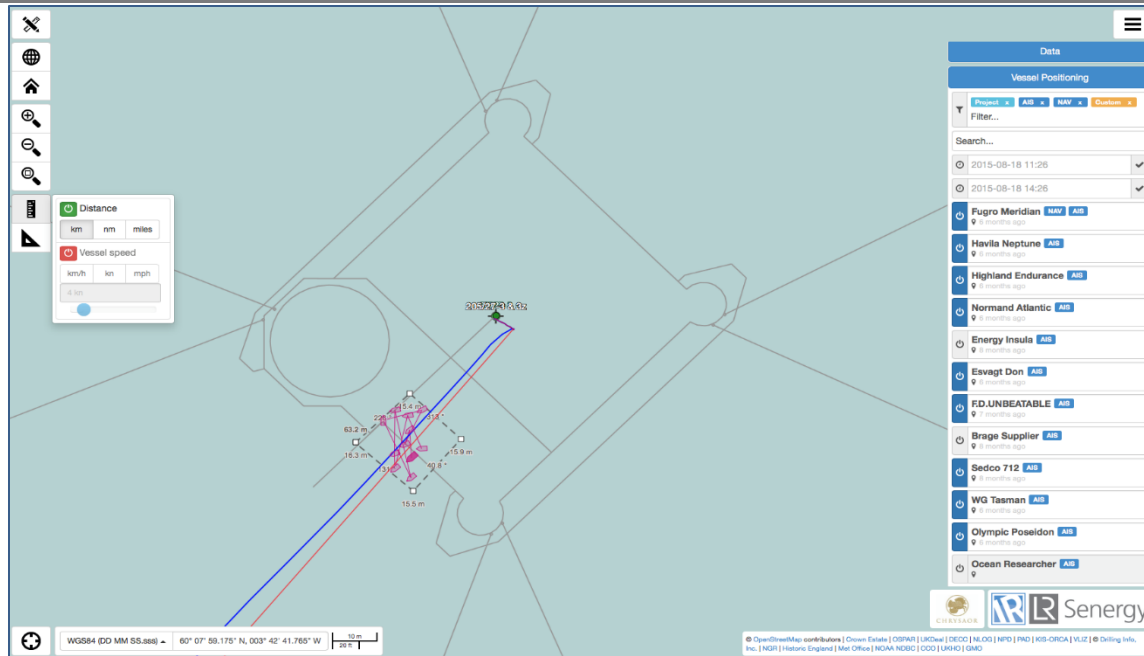

Project Example

Sedco 712; Chrysaor Mustard Well, WOS

Project Example

Sedco 712; Chrysaor Mustard Well, WOS

- Sd East (2σ)
 - ~4m
- Sd North (2σ)
 - ~6m
- Range to CRP
 - ~3m

Rig Positioning QA/QC

- Stand-alone hardware unit
- Installed by Client or Contractor
 - Power ON/OFF only
- Offsets checked independently
 - Gross check against GA (LR)
 - Potentially installed next to contractor antennae or clearly identifiable location
- Gyro calibration email for QA/QC
 - V-Node heading accuracy ($\pm 2^\circ$), plus misalignment
 - IRIS also receives rig AIS heading
- Comparison with contractor position data
 - Rig CRP and support vessels
- All raw data in WGS84
 - Independent geodetic transformation on IRIS

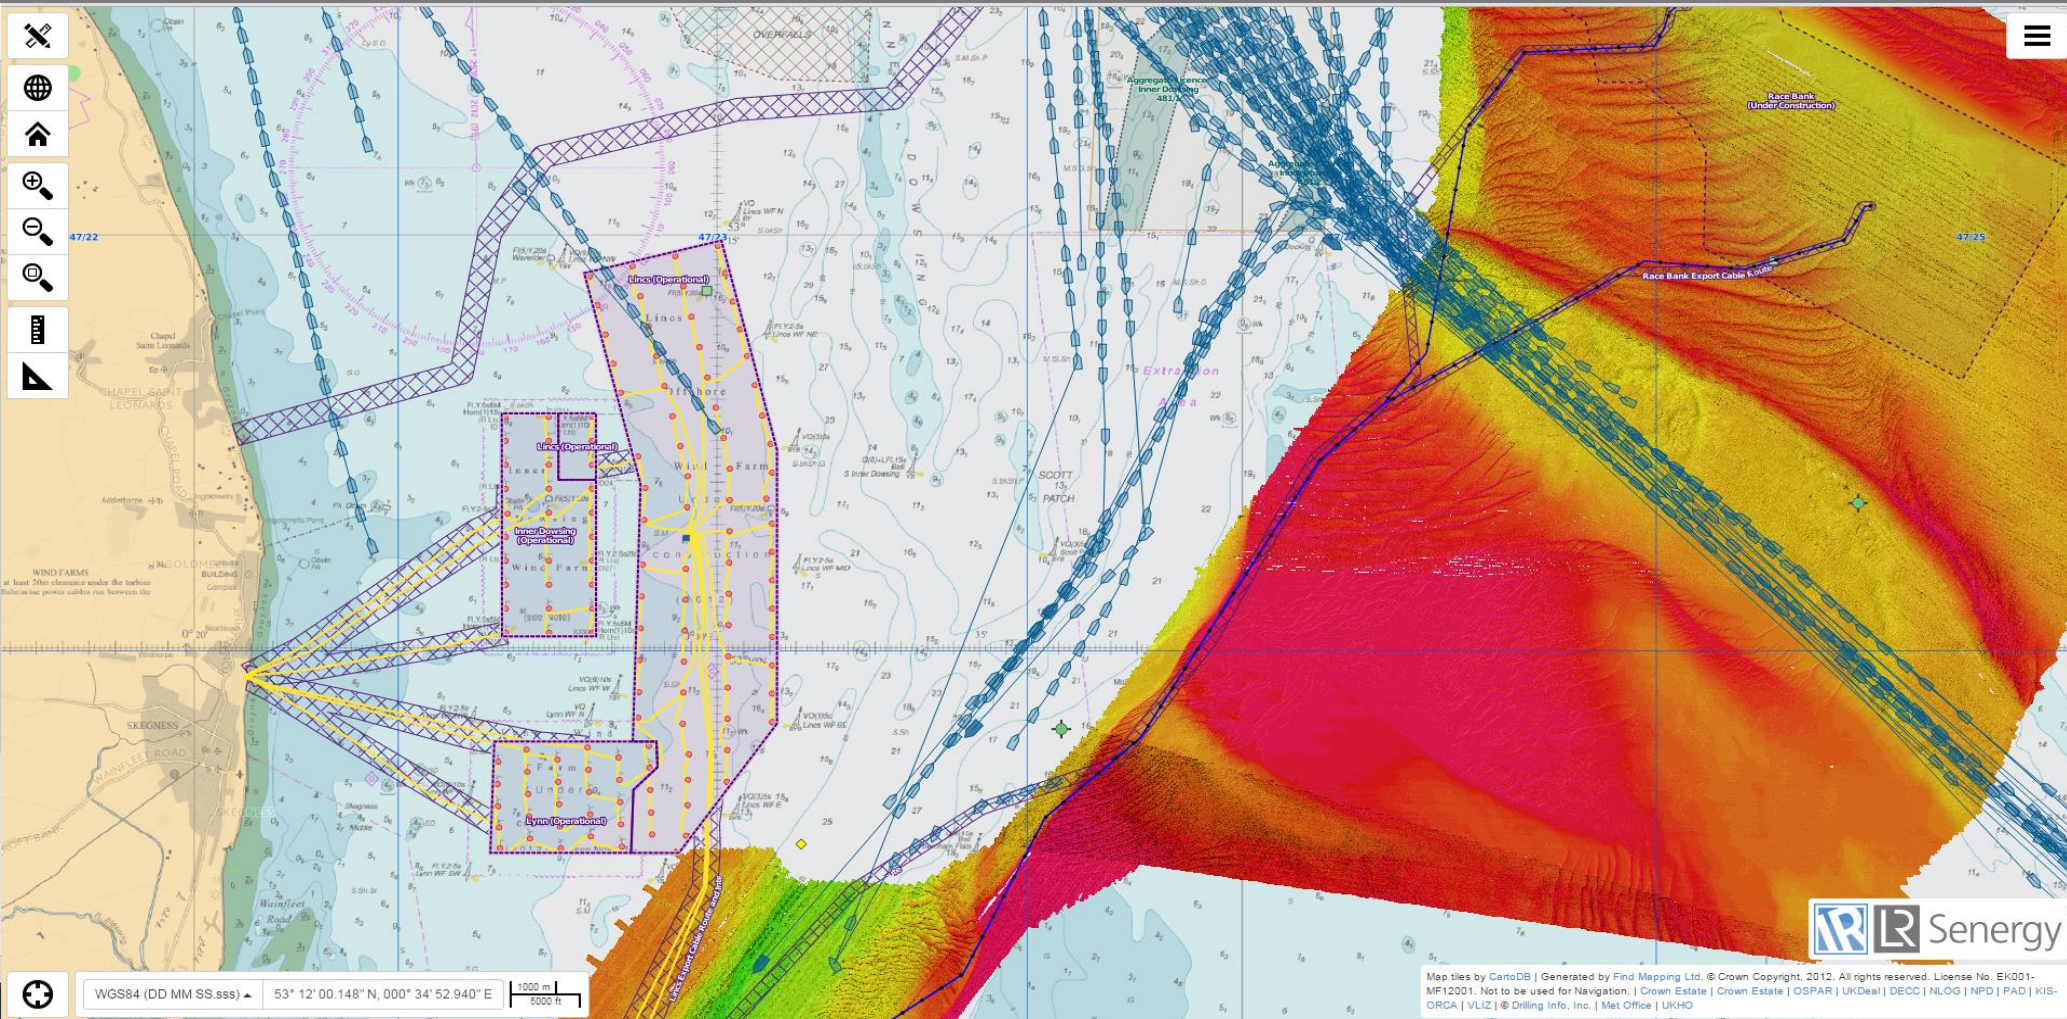

- Challenge - is this process sufficient QA/ QC to detect significant errors or blunders?

- Project Efficiencies

- No client representative
- No mob/demob fees, standby fees etc
- Daily cost for hardware/service

Data Availability

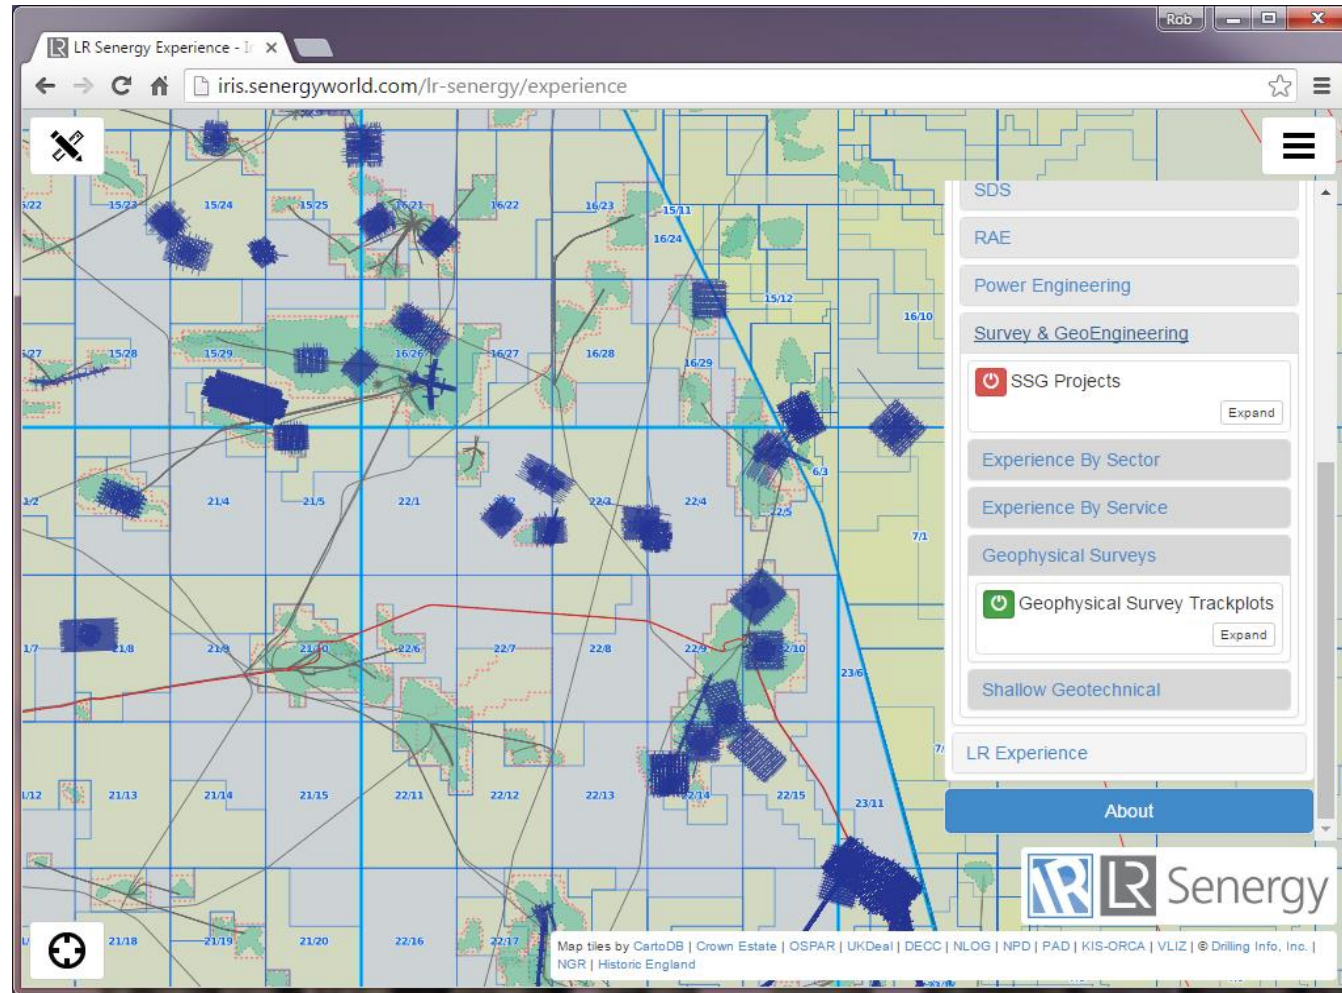

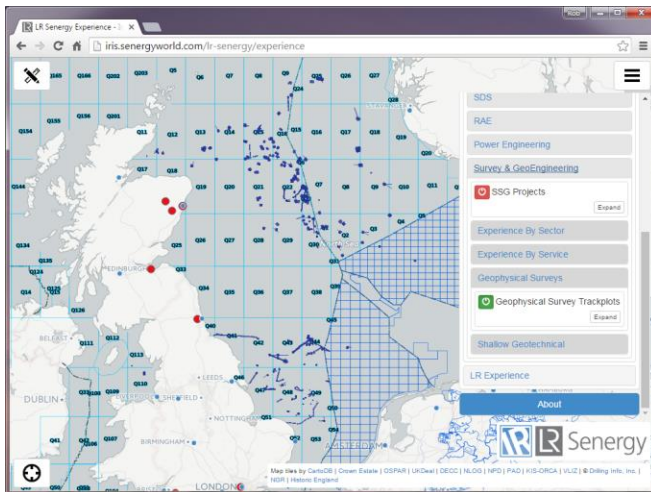

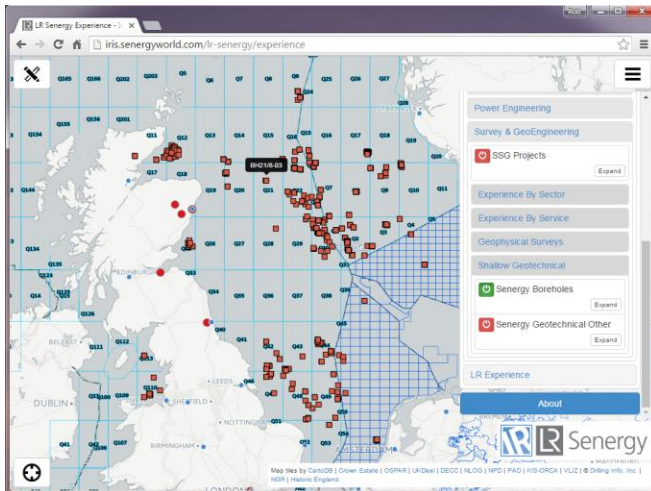

20

LR Senergy held survey & SI data

Not in the public domain....

Summary

- More data and information ensures the client/operator is better informed regarding a particular, very nice, but does it save money?
- Three 'live' project examples shown where cost efficiencies can be demonstrated
- Range of tangibility, but all developed to drive operational effectiveness
- A range of digital data service types and formats required to drive a 'live' web map, requires flexibility and capability.
- Serve data as well as consume

Together further
